

The Work About Us Course Shop Contact Login 0 2026 Email Remind Rebrand Remind is a platform trusted by 80% of U.S. schools to connect educators, students and families. Since launching in 2011, Remind has grown from a simple messaging app into a company offering a broad range of education tools. While the growth has been beyond exciting, it's also led to some growing pains: — The company's brand architecture had become unclear, and customers were confused about plan names. — Their audience was often unaware of the new services beyond messaging. — Remind's brand identity needed to better reflect the aspirational vision the company has for education, and the inspiring people they serve. Our team at Hoodzpah was brought on to breathe new life into the brand identity, while clarifying the product offering and broader company purpose. Our goal with the Remind rebrand: exude the ease of the app, and the positive connections it fosters, through updated naming, brand architecture, messaging, and visual identity. Remind Rebrand Scope: — Discovery & Strategy — Product Naming — Logo, Typography & Color — Messaging — Website Design — Illustration — Social Templates — Brand Guidelines Credits: — Website development and further web design based on our guidelines by Refokus — Animations by Ethan Silva, Bad Lucky Studio Client Collaborators: Huge thanks to the Remind team we worked with closely on this project: Quenton Cook (President and CEO), Courtney Drake (Director of Design), Tshaka Campbell (VP of Marketing), Jennifer Liu (Content Manager), Gulu Saiyed (Content Writer), and Remind photographers Taylor Chapman, and Patrick Michael Chin. Remind logos Wordmark and App Icon Remind's new wordmark is a custom type solution that combines the simplicity of a sans serif with the playful movement of a script. The personality-rich wordmark presents a unique and ownable logo without the need of a logomark. Being as the company's suite of products and offerings will continue to grow, dropping the logomark also consolidated the [Company]+[Product name] architecture, conserving space and simplifying the logo set. Remind logo before and after redesign by Hoodzpah branding studio Brand Architecture Remind has grown from an app for texting between educators and classrooms, to an education company offering many solutions for learning communities. "Remind" as a company needed to be given distinction from the Remind products. The Remind products included: 1. "Remind free account": A free product for teachers to message classes 2. "Remind Plan": An admin product helping schools and districts consolidate communication and collaboration 3. "Remind Coaching": A tutoring product for families and students which was causing confusion to users who assumed it was regarding school athletics. We re-addressed the naming and architecture to create a more clearly defined family of products whose names simply represented their purpose. Remind Brand Architecture and Naming before and after The Remind rebrand keyed off of a new tagline we created: "Your learning world, wonderfully connected." This simple phrase encapsulated the company's big purpose (learning and connection), and the method (wonderfully, because Remind's platform makes connecting easy, meaningful, and safe). This informed our design language. Remind learning platform rebrand by Hoodzpah Your World Connected 2 A simple design language of playful lines connecting wonky shapes visualizes making flexible, easy connections with the different people across a learning community. Remind connector lines and shapes Color Palette and Typography The updated brand color palette retains the primary "Mascot" blue used in the previous identity, as it was a fitting solution and would create a through-line of recognition for existing users. The new supporting palette is a vivid, cheerful array of oranges and plums. Headlines are lent an inviting, unassuming charm thanks to P22 Mackinac, a rounded-terminal

serif designed by Mike Beens. Body copy and smaller subheadings remain in Proxima Nova. Remind, a clean and versatile sans serif family by Mark Simonson, which Remind had customized for their unique in-app needs years ago. Remind rebrand color palette by Hoodzpah. Remind Typography. Remind Accessible Color Pairing. Illustration. We extended the playful lines into the illustration library. Remind's illustrations show everyday vignettes of education, with human, quirky twists (a hand waving from a computer, a cat distracting from homework). The illustrations feel warm and relatable. Illustrations Collage. Treatments. The connector lines and shapes integrate easily with brand photography, creating warm and lively collages. This simple but effective approach allows the Remind design team to output image assets easily at a large scale for use across the app, marketing touchpoints, print collateral, blogs and more. Remind color palette 1. Remind collage. Remind collage. The design language extends easily into social media and collateral. Social Media phone. Social Media Collateral Layout 2. Remind collateral design. We redesigned Remind's website to further clarify their product offering, showcase their bigger vision, and exude their helpful, inspirational brand personality. From refining the site structure, to updating the navigation, rewriting messaging, and redesigning core pages, we completely overhauled the marketing website. Refokus, an incredible design and development team, carried our foundational design work through to the remainder of the site pages and then brought it to life in Webflow. The work resulted in more quality click-throughs for Remind overall. Remind Website Homepage design by Hoodzpah. Remind website Families page design by Hoodzpah. UI Array. Remind by Hoodzpah. We designed UI Interpretations, or stylized representations of the actual Remind platform's interface. This gives users an evergreen idea of the platform without using exact UI screenshots (which would become outdated as updates were made). UI Interpretation. UI Interpretation. "We are so thrilled with Remind's new branding! It's fresh, sets us apart in education, and reflects our product and company. This brand system lays a strong foundation for Remind to develop new products and grow to serve more schools, teachers, and families. Hoodzpah was a true partner, from setting strategy and creating a new brand architecture to defining our visual identity. They balanced offering their expertise with listening to our needs throughout the process." – Courtney Drake, Director of Design at Remind. Visit Remind.com to see more. More of a good thing. Skip to main content. Logo. Mangrove Web. Our Work. About. Services. Thoughts. B Corp. Connect. RGD. AccessAbility. Making best practices in accessible design available and usable for everyone. The Association of Registered Graphic Designers (RGD) is a nonprofit organization dedicated to building a strong, supportive community for Canadian designers to share knowledge, set professional standards, and advocate for the value of design. The AccessAbility website extends RGD's commitment to inclusive design by making accessibility guidance clear and widely available. The site translates RGD's acclaimed AccessAbility handbook into a digital

experience everyone can use, helping designers apply these principles in their everyday work. A young woman using a laptop and wearing headphones The Ask RGD came to Mangrove for website design and development support to transform their AccessAbility handbook into a more widely available, inclusive digital experience. Previously, the resource existed only as a downloadable PDF, which made it harder to access, use, and update. Making changes or adding new content was difficult, limiting the ability to keep the guidance current. By bringing the content into a custom WordPress website, the goal was to make RGD's accessibility recommendations easier to navigate and apply when planning design projects. Just as importantly, the site itself needed to model these principles by being highly accessible to as many people as possible. RGD AccessAbility home page mockup on laptop and mobile screens The Solution We designed and developed the AccessAbility site on WordPress to create a flexible, customizable experience that fully supports accessibility best practices. Developing the site on WordPress gives RGD the ability to make changes and add new content easily, keeping the resource up to date as accessibility guidance, tools, and technologies continue to evolve. The platform allows content to be structured clearly, supports intuitive navigation, and ensures the site itself models the accessibility principles it promotes. The result is a digital resource that meets WCAG Level AA accessibility requirements and makes RGD's guidance easier to access and use across devices. Accessibility was considered at every stage of the work. We used a combination of the Equalize Digital plugin and our own manual accessibility checklist, alongside ongoing design and development review, to ensure the site met accessibility standards in both form and function. Mangrove also supported content strategy and development, helping translate the brochure into clear, up-to-date web content. By digitizing the AccessAbility handbook, the site makes education about accessible design even more accessible, expanding the reach and impact of RGD's work. Highlights The visual design thoughtfully incorporates RGD's branding and the look and feel of the AccessAbility brochure, ensuring a cohesive experience across formats. The site supports the easy addition of new resources and case studies, highlighting how accessible design can be effective, functional, and beautiful. RGD Case Study page screenshot RGD ibility and readability page screenshot RGD AccessAbility on three mobile screens Working with Mangrove on the AccessAbility website was a great opportunity! Their attention to detail and incorporation of accessibility into every aspect of the design honoured the core principles behind RGD's AccessAbility handbook. They were a great team who encouraged collaboration and input from us. Rachel Chen Product Designer + Engineer Work Fun About Resume RacheLLM Back Overview
Solution Core Flows Research Exploring Form Factors Prototyping and Testing Design
Decisions Designing for Hardware Constraints Reflection OpenAI x Hardware • Concept 2025
The future of AI & hardware Role Product Designer Timeline August - September 2025 Team 3
Designers Skills Product Design Product Strategy Prototyping Overview What should OpenAI
build as their first AI device? As a team of 3 product designers, our goal was to land on a clear
vision within 7 weeks. Product Strategy Thinking broadly about OpenAI, the AI landscape, and
exploring widely in the solution space. Prototyping & Testing Going wide in ideation and rapidly
testing concepts with users. Iterating with Feedback Continuously iterating on concepts and
validating product decisions. Problem ChatGPT is at the top of the of the stack. ChatGPT is an
app, at the top of this technology stack. That's a risky place to be because it means leaves
OpenAI at the mercy of the lower layers, like the platform, the operating system, and the
hardware. /projects/openai/1-problem.svg Apple and Google are building their own consumer AI
ecosystems, but with the advantage of being able to control the entire stack. However, OpenAI
is currently dominating consumer AI, and Apple has recently dropped the ball on their Apple
Intelligence integrations. This creates an opportunity for OpenAI to build an AI device and
capture consumers in their own ecosystem. Opportunity Memory as the core of OpenAI's device
ecosystem. Memory should be OpenAI's new moat. LLMs are becoming commoditized, but
personalization and context are the new differentiators. With hardware, OpenAI will benefit from:
Independence No longer at the mercy of the lower layers Ecosystem lock-in Capture users with
a tightly-integrated experience like Apple does today New input modalities A device that can
see, hear, and remember in ways an app can't Solution Tomo: the AI device that remembers so
you don't have to... A pin and pendant wearable, serving as a camera and microphone
on-the-go. /projects/openai/2-tomo.png ...powering Moments, logging memories in your
everyday life in ChatGPT. Moments is a new atomic unit in ChatGPT, logging all the events,
conversations, and solo adventures captured with Tomo. Core Flows Smart prompts,
in-the-moment Get prompts relevant to you in-the-moment, with Tomo. Chat with real-time
context ChatGPT can now respond to you with understanding of your real life. Look back on
your moments In the new Moments page, you can look back on everything that's happened,
categorized by context. Review a specific moment Tap into each moment to see all the
important things that happened. Onboarding to Tomo Designing for an experience that will show
users how Moments work and the immediate value of Tomo. Research Researching the AI
landscape and current devices on the market We went deep into understanding OpenAI, and
the world of consumer AI, agents, trends, and more. We researched existing devices and tried
some out ourselves! /projects/openai/4-ai-rabbit-hole.png Exploring Form Factors Exploring
product direction and form factor We explored product direction and form factor, and designed
for an experience that will show users how Moments work and the immediate value of Tomo.
Strategic Directions Productivity Tools Targeting students, massive AI adopters, with a familiar
form factor. Home Devices A less competitive space with fewer constraints on battery life and
data plans. Wearables On-the-go form factors fit for mass adoption.
/projects/openai/5-form-factor.png Why Tomo? Enhances ChatGPT Leverages the app's large
and fast-growing user base. Leverages OpenAI's strengths Taps into OpenAI's unique strengths
of strong foundational models, memory, and agents. Easier to scale Much cheaper to build and

easier to scale than glasses, watches etc. [/projects/openai/7-why-tomo.png](#) Prototyping and Testing Prototyping interfaces for real-world memory We explored a ton of concepts for these 3 strategic directions, here are select few of them: ChatGPT Feature Power-ups Using real-life context to enhance existing features in the app In-the-moment Canvas Exploring interfaces focused on real-time assistance Memory-centered UI Focusing on helping users look back on their day Testing and iterating with feedback! We got users to try these prototypes, observed how they used them, how they felt, and got tons of valuable feedback. Key User Insights Memory for recall, not reliving People want to look back and remembering important things, rather than re-experiencing them. Surface relevant suggestions Users want personalized prompts, reminders, and tasks—both in the moment and as a recap at the end of their day. Design Decisions We identified the most intuitive way to bring this feature to life. With insights and iteration from prototyping and testing, we got to thinking how a clear, intuitive solution could be integrated within the existing ChatGPT ecosystem. [/projects/openai/systems-thinking.svg](#) Where we landed Insight 1: Memory for recall, not reliving Moments as chat context People want to look back and remembering important things, rather than re-experiencing them. [/projects/openai/ins-moment-page.png](#) Moments log as a new page Users want personalized prompts, reminders, and tasks—both in the moment and as a recap at the end of their day. Insight 2: Surface relevant suggestions [/projects/openai/ins-prompt.png](#) Smart prompts in-the-moment We want to give users relevant prompts with real-time context, in a less invasive way than our initial exploration. Smart Prompts for every moment With prompts for every moment, users can look back on their day and get smart suggestions. Designing for Hardware Constraints A device that is light-weight and always-recording isn't possible, yet. We researched a bunch of products and found that high-quality camera recording doesn't last more than a few hours. [/projects/openai/research-devices.png](#) So we had to ask: How do we maximize memory despite constraints of camera battery life? Constraining the experience Context-based Capture In this case, Tomo would use real-time cues to choose when to record, balancing battery with context capture. [/projects/openai/context-based.png](#) Considerations [/projects/openai/cons-1.png](#) How do we communicate rationale for recording? We could use a notification to let users know why Tomo is recording. [/projects/openai/cons-2.png](#) Can AI detect when to record? We found that with transcripts alone, AI is pretty good at identifying moments worth recording. Manual Capture In this case, the user is always manually pressing or holding down the button to capture images and videos. [/projects/openai/manual-capture.png](#) Considerations [/projects/openai/cons-3.png](#) How do we remind users to record? We could have a subtle on-device indicator to remind users to record at specific moments with non-visual cues. [/projects/openai/cons-4.png](#) What does a less visual interface look like? We could use icons to represent moments without visual captures, and pull context from other sources, like LinkedIn headshots for coffee chats. [/projects/openai/cons-5.png](#) How do we deal with imperfect captures? We can use AI to enhance captures, like making shots more flattering, or making blurry photos clearer. Trading memory for privacy With manual capture, we're making this tradeoff of less memory captured for more user privacy. This is something we should lean into as a strength. Privacy really matters to users, and we want to make it a deliberate design decision that helps us gain trust with users and lowers the barrier to entry of using a product like this. [/projects/openai/memory-vs-privacy.png](#) This is a trade-off that we're willing to make for mass adoption. Reflection What I learned Social signals matter. We can't design just for the

user, but also for those who will be around them and perceive them. What does Tomo imply for social settings? How can we design hardware for self-expression? Think in systems. It's not just about designing an amazing feature, but how it fits into the existing system, and how it fits into users' mental models.
